In each page, the title is the explanatory form card tag @xx, with its full name in ()
Each explanatory form card has its version in 4 cases showing in sequence: house, health, car, bird. Some cards only contains 2 or 1 cases.

Some cards has a second row, indicating those are earlier versions of the cards and were not used in later interviews.

@input

The features of your own house

- 2 bedrooms
- 1 bathroom
- 780 sq
- 20 years old
- household appliances for 10 years
- distance to school, parks: 2 km

The data from your health records used for prediction:

- Male, 33 years old
- Three consecutive blood sugar level: normal, normal, higher than normal
- Body weight: 75 kg, height 175 cm
- Calories intake per day: 3200
- Minutes of exercise per week: 50 min
- Family history of diabetes: ……
- ……

Current traffic view:

The image you uploaded:

@output

Predicted price of your own house

$ 650,000

with certainty of 90%

$ 638 ~ 662,000

with certainty of 95%

Your chance of getting diabetes within the next year is:

80 %

with a certainty of 90%

75 ~ 85%

with a certainty of 95%

Driving decisions under the current traffic:

	Confidence
Keep straight	95%
Keep speed at 50 km/h	95%
Right lane change	55%

The image you uploaded is recognized as:

	Likelihood
Indigo Bunting	95%
Blue Grosbeak	70%
Lazuli Bunting	55%

Predicted price of your own house

$ 650,000

Your chance of getting diabetes within the next year is:

80 %

Those two only used in earlier version of the interview

@performance

The performance of the AI house precdiction tool

- Mean prediction error: ± 50,000
- Max prediction error: ± 120,000
- The AI tool can explain 95% of the variation in the training data

The performance of the AI tool to predict diabetes risk

- Mean prediction error: ± 15%
- Max prediction error: ± 30%
- The AI tool can explain 75% of the variation in the training data

Overall performance of the autonomous driving mode:

*Measured using average distance driven between disengagements**

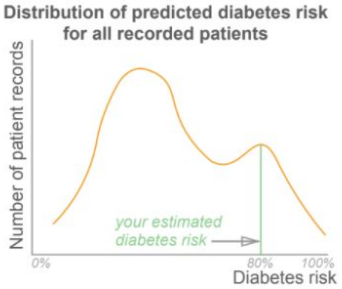
- Under **normal** road condition: 40 km
- During the **night**: 5 km
- On **rainy** days: 3 km
- On **snowy** days: 1 km

* Disengagement means when the automated system is switched off by the intervention of a human driver

Overall performance of the AI bird recognition tool:

- Accuracy: 85%
- Error rate: 15%

@prior (output prediction with prior distribution of each class in the training set)

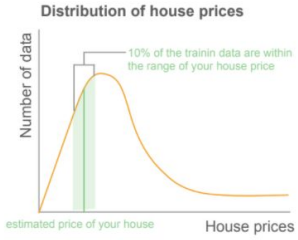


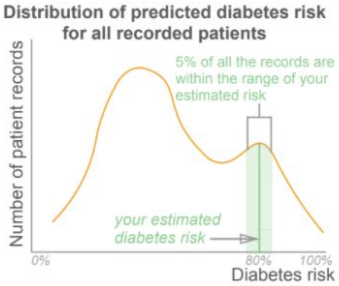
The current driving decisions, and **their percentage in the training dataset** where the self-driving car learns from

	Confidence	Precentage
Keep straight	95%	25%
Keep current speed	95%	34%
Right lane change	55%	2.9%

The three most likely bird according to your uploaded image, and **their percentage in the training dataset** where the AI learns from

	Likelihood	Precentage
Indigo Bunting	95%	1.5%
Blue Grosbeak	70%	1.2%
Lazuli Bunting	55%	1.3%

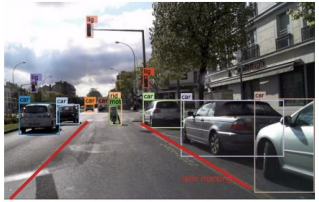




Those two only used in earlier version of the interview

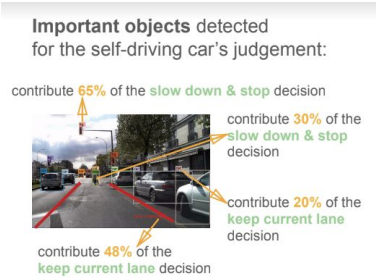
@ir (important regions)

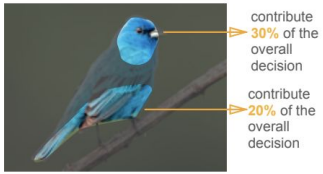
Important objects detected
for the self-driving car's judgement:



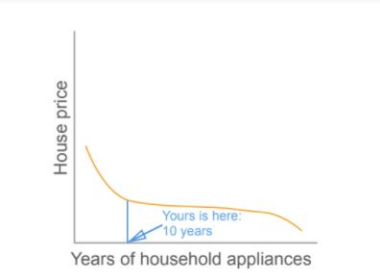
Important regions (highlighted)
for AI's bird recognization:

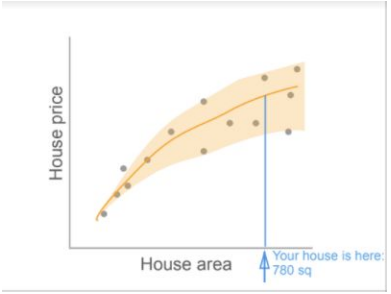
@irc (important regions with their feature contribution percentage)



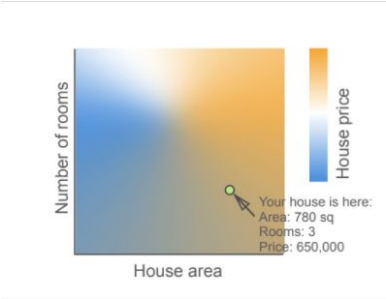


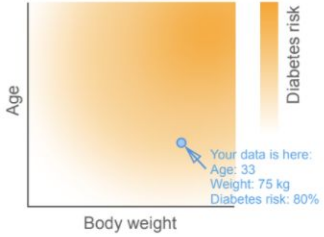
@fs (feature shape)



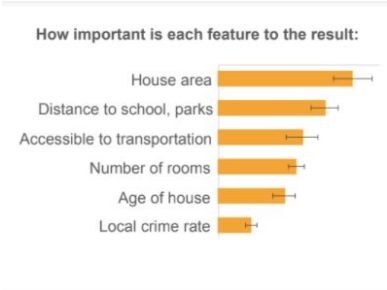


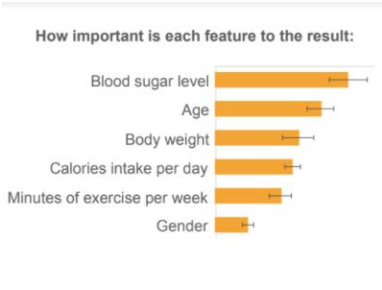
@fi (feature interaction)

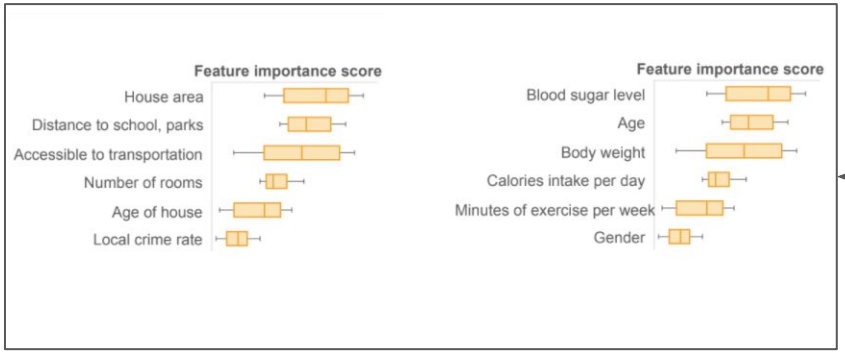




@fa (feature attribute)



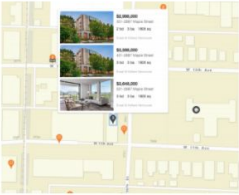




Those two only used in earlier version of the interview

@se (similar example)

The houses of **similar *features*** as yours



The case that has **similar *features*** as yours:

- Male, 35 years old
- Three consecutive blood sugar level: normal, normal, higher than normal
- Body weight: 81 kg, height 183 cm
- Calories intake per day: 3400
- Minutes of exercise per week: 60 min
- Family history of diabetes: ……
- ……

Similar traffic conditions as the current one, from the dataset to train the self-driving car:

Similar images to the one you uploaded:

Indigo Bunting 95%
Indigo Bunting 95%
Blue Grosbeak 70%
Blue Grosbeak 70%
Lazuli Bunting 55%
Painted Bunting 45%

@te (typical example)

The houses of **similar *price*** as yours

The case that has the **similar *diabetes risk*** as yours:

- Male, 32 years old
- Three consecutive blood sugar level: higher than normal, higher than normal, normal
- Body weight: 80 kg, height 178 cm
- Calories intake per day: 2900
- Minutes of exercise per week: 30 min
- Family history of diabetes: ……
- ……

Typical traffic conditions to reach the self-driving car's current decison:

Keep straight 95%	**Keep current speed** 70%	**Right lane change** 55%

The three most likely bird according to your uploaded image, and **typical examples**

Indigo Bunting 95%	**Blue Grosbeak** 70%	**Lazuli Bunting** 55%

A **typical** house to sell at the estimated price as yours is like:

In your neighbourhood:

- 2 bedrooms
- 2 bathrooms
- 1000 sq
- 20 years old
- ……

A **typical** case of the same diabetes risk as yours is like:

- Male, 45 years old
- Three consecutive blood sugar level: normal, normal, higher than normal
- Body weight: 78 kg, height 175 cm
- Calories intake per day: 3000
- Minutes of exercise per week: 30 min
- Family history of diabetes: ……
- ……

← Those two only used in earlier version of the interview

@ce (counterfactual example)

If the feature of your house had changed to the following feature,
your house price would have increased by 10%:

- have a back yard, or
- 3 bathrooms, or
- 1200 sq, or
- less than 10 years old, or
- has new household appliances
- ……

If your health data had changed to the following,
your diabetes risk would have decreased by 20%:

- 3 years younger than now
- Body weight: loss 5 kg
- Increase 50 min of weekly exercise
- Reduce 500 calories of daily calories intake
- ……

@ceh (counterfactual example with the contrastive feature highlighted)

@cet (counterfactual example transition from one example to the counterfactual one)

@rt (rule text)

If **house area** ≤ 800 sq,
and **distance to school, parks** > 2.5 km,
Then house price **is no more than 600,000**

If **house area** is 800 - 900 sq,
and **distance to school, parks** < 2.5 km,
Then house price **is about 700,000-850,000**

If **blood sugar** is **high**,
and **body weight** is **overweighted**,
Then the estimated diabetes risk **is above 80%**

If **blood sugar** is **normal**,
and **body weight** is **overweighted**,
Then the estimated diabetes risk **is about 20-50%**

If **traffic sign** is **stop sign**,
or the speed of the **car in front** are **slower**,
Then the speed decision is to **slow down and stop**

If **traffic sign** is **50km/h speed limit**,
and the speed of the **car in front** are the **same or faster**,
Then the speed is kept at **50km/h**

If **bird bill** is **small and thin**,
and **wings and tails** are **short**,
Then the bird is recognized as **Indigo Bunting**

If **bird bill** is **big and thick**,
and **wings and tails** are **long**,
Then the bird is recognized as **Blue Grosbeaks**

	house area	distance to school, parks	house price prediction
Rule 1	≤ 800 sq	> 2.5 km	< 600,000
Rule 2	≤ 800 sq	< 2.5 km	600,000-700,000
Rule 3	800-900 sq	< 2.5 km	700,000-850,000

	blood sugar	body weight	diabetes risk
Rule 1	high	high	> 80%
Rule 2	high	normal	50-80%
Rule 3	normal	normal	< 20%

Rule matrix, only used in early interviews
